

way only deters growth of the economy, chokes the economy, while it creates poverty and all the other economic ills mentioned above. Such a system of monetary control is neither fitting or deserving of a free society claiming to operate as a free enterprise system. Such a system is doomed to failure as evidenced by our high rate of poverty, unemployment and bankruptcy.

OBJECT OF THIS INVENTION AND SOLUTION TO THE PROBLEM

The object of this patent is to create an economy wherein consumption will always equal production and thereby eliminate all inflation, recession, poverty, unemployment, hunger, homelessness, foreclosure, bankruptcy and repossession generated by a short money supply. Prospernomics creates a perpetual condition wherein consumption will always equal production. In order for all new production, all new goods and services, to equal consumption there must be a corresponding and equal creation of new money so that all of the new goods and services can be consumed. It is only logical that a money supply smaller than the worth of new goods and services produced prevents the consumption of all the new goods and services. The method outlined in this patent provides for the creation of new dollars whenever new goods and services, production, are produced, thereby allowing the consumption of all of the new goods and services to be effected. In order for consumption to equal production it logically follows that new dollars must be created equal to the new goods and services being produced. This patent achieves exactly that.

The total value of all new goods and services are necessarily created by the total of the earnings of the investor, the company and the employees. It starts with the investor

who earns his money by investing it in some production of a good and/or service. Then, the company earns a profit by producing those goods and/or services. Finally, the employees earn wages for their contribution to the production of those goods and/or services. The total value of all goods and services created logically equals the earnings of all three, the earnings of the investor, the earnings of the company and the earnings of the employees. Of course you must include the earnings of the distributors and dealers in calculating the final worth of all newly produced goods and services.

OR

Without any legislation referred to above a bank can issue a loan to an earner for his earnings and, following the same procedure as above, pay the earner's taxes singly, doubly or otherwise and keep the difference as payment for the service to the earner and the city, county, state and federal governments.
